Let A be an $n \times n$ complex matrix. The numerical range of A is defined and denoted by

$$W(A) = \{x^*Ax; x \in \mathbb{C}^n, \|x\| = 1\}.$$

The homogeneous polynomial:

 $F_{\mathcal{A}}(t,x,y) = \det(tI_n + x\Re(\mathcal{A}) + y\Im(\mathcal{A})),$

and $\Re(A) = (A + A^*)/2, \Im(A) = (A - A^*)/(2i).$

・ロト ・ 日 ・ ・ ヨ ・ ・ ヨ ・ うへで

The diameter $\operatorname{diam}(W(A))$ of W(A) is defined to be the largest distance of two parallel lines tangent to its boundary.

The width width(W(A)) the smallest distance of two parallel lines tangent to its boundary.

The boundary curve of W(A) is called a *curve of constant width* if diam(W(A)) = width(W(A)).

Our work

- Provide an algorithm for computing the diameter and width of the numerical range.
- Formulate the diameter and width of the numerical range of some unitary bordering matrices.
- Determine the condition for the boundary of the numerical range of certain Toeplitz matrices to be a curve of constant width.

An algorithm for computing the diameter and width

Let A be an $n \times n$ matrix. For $0 \le \theta \le 2\pi$, we consider the Cartesian decomposition

$$e^{-i heta}A = \Re(e^{-i heta}A) + i\Im(e^{-i heta}A).$$

Denote $H_A(\theta) = \Re(e^{-i\theta}A)$, and its eigenvalues

$$\lambda_1(\theta) \geq \lambda_2(\theta) \geq \ldots \geq \lambda_n(\theta).$$

$$e^{-i\theta}A = (\cos\theta - i\sin\theta)(\Re(A) + i\Im(A)),$$

it follows that

$$H_A(\theta) = \cos\theta \,\Re(A) + \sin\theta \,\Im(A).$$

Hence, the characteristic polynomial of $H_A(\theta)$ is exactly equal to

 $F_{\mathcal{A}}(t, -\cos\theta, -\sin\theta) = \det(tI - \cos\theta \,\Re(\mathcal{A}) - \sin\theta \,\Im(\mathcal{A})).$

Theorem 1 Let A be an $n \times n$ matrix. Then

$$\operatorname{diam}(W(A)) = \max\{\lambda_1(\theta) - \lambda_n(\theta) : 0 \le \theta \le 2\pi\}$$
(2.1)

 and

width
$$(W(A)) = \min\{\lambda_1(\theta) - \lambda_n(\theta) : 0 \le \theta \le 2\pi\},$$
 (2.2)
where $\lambda_1(\theta) \ge \lambda_2(\theta) \ge \cdots \ge \lambda_n(\theta)$ are eigenvalues of $H_A(\theta)$.

<ロ > < 団 > < 臣 > < 臣 > < 臣 > < 臣 > ろ < で 7/25

The resultant of two polynomials f(Y), g(Y) due to Sylvester:

Let

$$f(Y) = a_m Y^m + a_{m-1} Y^{m-1} + \dots + a_1 Y + a_0$$
$$g(Y) = b_n Y^n + b_{n-1} Y^{n-1} + \dots + b_1 Y + b_0$$

be polynomials in Y with non-zero leading coefficients a_m , b_n , and the coefficients a_i , b_k are functions in other variables.

The resultant of f(Y) and g(Y) is defined as the determinant of the $(n + m) \times (n + m)$ -matrix:

	(a _m	a_{m-1}	a_{m-2}		0	0	0 \	
R(f,g) =	0	am	a_{m-1}		0	0	0	
		:	:	÷	÷	÷	÷	
	0	0	0		a_1	a_0	0	
	0	0	0		a_2	a_1	a_0	
	bn	b_{n-1}	b_{n-2}		0	0	0	
	0	bn	b_{n-1}		0	0	0	
	:	:	:	:	:	:	:	
	0	0	0		b_1	b_0	0	
	0/	0	0		b_2	b_1	ь,)	

It is well known f and g have a common zero iff det(R(f,g)) = 0.

Obviously, the function $\lambda_1(\theta) - \lambda_n(\theta)$ is a zero of the polynomial

$$\prod_{1\leq j\neq k\leq n} (Z-(\lambda_j(\theta)-\lambda_k(\theta))).$$

This means that once we obtained the above polynomial, the diameter $\operatorname{diam}(W(A))$, according to Theorem 1, can be derived.

Consider the polynomial

$$p(t) = t^n + a_1t^{n-1} + \ldots + a_{n-1}t + a_n = \prod_{1 \le i \le n} (t - \lambda_i).$$

Assume R(Z) is the resultant of p(Y + Z) and p(Y) with respect to Y. Then $R(Z)/Z^n$ is the required polynomial:

$$\prod_{1\leq j\neq k\leq n} (Z-(\lambda_j-\lambda_k)).$$

・ロ ・ ・ 一 ・ ・ 注 ・ ・ 注 ・ う へ (や 10/25

Accordingly, let $R(Z, -\cos\theta, -\sin\theta)$ be the resultant of the polynomials $F_A(Y, -\cos\theta, -\sin\theta)$ and $F_A(Y + Z, -\cos\theta, -\sin\theta)$ with respect to Y. Then $R(Z, -\cos\theta, -\sin\theta)/Z^n$ is

$$K(Z, -\cos \theta, -\sin \theta) = \prod_{1 \le j \ne k \le n} (Z - (\lambda_j(\theta) - \lambda_k(\theta))).$$

Theorem 2 Let A be an $n \times n$ matrix. Let R(Z, x, y) be the resultant of $F_A(Y, x, y)$ and $F_A(Y + Z, x, y)$ with respect to Y, and $K_A(Z, x, y) = R(Z, x, y)/Z^n$. Then

 $\operatorname{diam}(W(A)) = \max\{Z \in \mathbb{R} : K_A(Z, -\cos\theta, -\sin\theta) = 0, \, 0 \le \theta \le 2\pi\},\$

width(
$$W(A)$$
) = $\min_{0 \le \theta \le 2\pi} \max\{Z \in \mathbb{R} : K_A(Z, -\cos\theta, -\sin\theta) = 0\}.$

 Changing the variable $s = tan(\theta/2)$,

$$\operatorname{diam}(W(A)) = \sup \Big\{ Z \in \mathbb{R} : K_A(Z, -\frac{1-s^2}{1+s^2}, -\frac{2s}{1+s^2}) = 0, -\infty < s < \infty \Big\},$$

$$\begin{split} \mathrm{width}(W(A)) &= \inf \Big\{ \sup\{Z \in \mathbb{R} : \mathcal{K}_A(Z, -\frac{1-s^2}{1+s^2}, -\frac{2s}{1+s^2}) = 0 \}, \\ &-\infty < s < \infty \Big\}. \end{split}$$

<□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

Example 1

Consider the matrix

$$A = \begin{pmatrix} 23 & 1+i & 6-5i \\ 4+5i & 6i & 7 \\ 2+i & -3+5i & -9i \end{pmatrix}.$$

Then the polynomial $K_A(Z, x, y)$ becomes

 $K_A(Z, x, y) = 16Z^6 - 16(1331x^2 + 378xy + 645y^2)Z^4 + 4(1331x^2 + 378xy + 645y^2)^2Z^2$

 $-198638261x^{6} - 785100590x^{5}y - 1971769127x^{4}y^{2} - 503512476x^{3}y^{3} - 238036399x^{2}y^{4} - 88713198xy^{5} - 77494717y^{6}.$

The resultant of $K_0(Z, s)$ and its derivative $K'_0(Z, s)$ with respect to *s* contains the following polynomial factor :

 $L(Z) = 1368783469011353600Z^{24} + \cdots$

The maximal real root of L(Z) = 0 is approximately 29.6976 which is diam(W(A)). The minimal real root is approximately 19.8313 which is width(W(A)).

Formulate diameter and width of unitary bordering matrices

An $n \times n$ complex matrix A is called a unitary bordering matrix if A is a contraction, that is, $\langle A^*A\xi, \xi \rangle \leq \langle \xi, \xi \rangle$ for $\xi \in \mathbb{C}^n$, $\operatorname{rank}(I_n - A^*A) = 1$

and the modulus of any eigenvalue of A is strictly less than 1.

Gau-Wu(1998), Mirman(1998):

The entries of a standard form of a unitary bordering matrix $A = (a_{ij})$ in the upper triangular form, up to unitary equivalence, are determined by its eigenvalues a_1, a_2, \ldots, a_n in the following way

$$a_{ij} = \begin{cases} a_i & \text{if } i = j \\ \left(\prod_{k=i+1}^{j-1} (-\overline{a_k})\right) \sqrt{(1 - |a_i|^2)(1 - |a_j|^2)} & \text{if } i < j \\ 0 & \text{if } i > j \end{cases}$$

<□ > < □ > < □ > < Ξ > < Ξ > < Ξ > ○ < ○ 15/25</p>

For simplicity, we consider an $n \times n$ unitary bordering matrix with eigenvalues

$$\{a \exp(i\frac{2k\pi}{n}): k = 0, 1, 2, \dots, n-1\}$$

for 0 < a < 1. The standard form of such an $n \times n$ unitary bordering matrix A is denoted by $A_n(a)$. By the resultant formulae of Theorem 2, we compute that

Theorem 3 Let $A_n(a)$ be the standard unitary bordering matrix as defined above. Then,

- 1. For n = 2, diam $(W(A_2(a))) = 1 + a^2$ and width $(W(A_2(a))) = 1 a^2$,
- 2. For n = 3, diam $(W(A_3(a))) = (2 + a^6)^{1/2}$ and width $(W(A_3(a))) = (2 + (a^6/4))^{1/2}$,
- 3. For n = 4, $\operatorname{diam}(W(A_4(a))) = \frac{1}{\sqrt{2}}\sqrt{a^8 + 3 + \sqrt{a^{16} + 2a^8 + 8a^4 + 5}} \text{ and}$ $\operatorname{width}(W(A_4(a))) = \frac{1}{\sqrt{2}}\sqrt{a^8 + 3 + \sqrt{a^{16} + 2a^8 - 8a^4 + 5}}.$

Curve of constant width for certain Toeplitz matrices

Reuleaux triangle:

Reuleaux triangle:curve of constant width

Conjecture:

If C is a curve of constant width and it is the boundary of the numerical range of a matrix, then C is a circle or a single point.

Denote $T(\beta_1, \ldots, \beta_{n-1})$ the $n \times n$ nilpotent Toeplitz matrix:

/0	β_1	β_2	β_3	 β_{n-2}	β_{n-1}	
0	0	β_1	β_2	 β_{n-3}	β_{n-2}	
0	0	0	β_1	 β_{n-4}	β_{n-3}	
١.					.	
1:	:	:	:	:	:	
0	0	0	0	 0	β_1	
/0	0	0	0	 0	o /	

If n = 2m is even, we denote

 $A(\beta_1,\beta_2,\ldots,\beta_{m-1},\beta_m)=T(\beta_1,\beta_2,\ldots,\beta_{m-1},\beta_m,\overline{\beta_{m-1}},\ldots,\overline{\beta_2},\overline{\beta_1}).$

If n = 2m - 1 is odd,

 $A(\beta_1,\beta_2,\ldots,\beta_{m-1})=T(\beta_1,\beta_2,\ldots,\beta_{m-1},\overline{\beta_{m-1}},\ldots,\overline{\beta_2},\overline{\beta_1}).$
